
PictoHub

Artem Batutin

October 29 2018

Changes / Notes

- Reply model renamed to Comment.
- Model process is defined as follows:
Board -> Thread List -> Thread (Details) retrieves List<Comment> by ThreadId

- Setting panel not implemented because of the complexity of the project and the redundancy of the feature itself.
-

- Logo placement is at the bottom:

- All DBSets are in **ApplicationDbContext**.

```
public class ApplicationDbContext : IdentityDbContext<ApplicationUser>
{
    public ApplicationDbContext() : base("DefaultConnection", throwIfV1Schema: false) {
    }

    public static ApplicationDbContext Create() {
        return new ApplicationDbContext();
    }

    public System.Data.Entity.DbSet<PictoHub.Models.Thread> Threads { get; set; }

    public System.Data.Entity.DbSet<PictoHub.Models.Board> Boards { get; set; }

    public System.Data.Entity.DbSet<PictoHub.Models.Hub.Comment> Comments { get; set; }
}
```

- A lot of Controllers changes.

Validation

regular expression: Models.AccountViewModels.RegisterViewModel -> Email range

required: Anywhere in Model.Hub.*

compare: Models.AccountViewModels.RegisterViewModel -> ConfirmPassword

datatype: RegisterViewModel -> Password, Thread->Conten, Thread->Date

custom validator: Models.AccountViewModels.LoginViewModel -> [EmailAddress]

Design notes:

All pages match the wireframes, only differences is the input because customizing with CSS wasn't identical than designing the page in PhotoShop.

Hence some minor details were not possible to be translated into the final site product.

Navigation

Whole website is navigated via the Board -> Thread schema. All 'back' links allowed. About and contact page added to navigation bar at the top.
